

ABSTRACT OF THE DISCLOSURE

Balanced view generation of pages of electronic documents is disclosed. In one embodiment, balancing the text of a page without forcing any of the text onto previous or subsequent pages is accomplished on a rolling pair of lines-by-rolling pair of lines basis.

- 5 For each of a series of rolling pairs of lines of the page (for example, lines of text), it is determined whether a first line of the rolling pair is less than a second line of the rolling pair in length. If so, then it is determined whether a last word of the first line would fit as a first word of the second line, and whether so doing would meet a predetermined criteria. If so, then this action is performed.
